

PeerStory: Devo

This PeerStory is a collection of quotes from a real user sharing their experience using Devo on IT Central Station.

Director Cyber Threat Intelligence
at IGT

Valuable Features

It's very intuitive. The interface is extremely useful. You can perform many functions from one page. In other tools that we looked at, you'd have to toggle back and forth between screens and you'd have to exit one menu and copy and paste things into another section. With Devo you can do everything using drop-downs.

It's very user-friendly when creating queries and dynamic lists. You can modify the interface to look the way you want with columns and sorting. It's very well thought out.

It's also very easy to pull data into it from various log sources, even if they're custom homegrown apps. The parsers are also very easy to use.

The fact that Devo only charges for ingestion works great for us. In some of the other solutions we looked at, depending on what you were doing with the data, extra charges were assessed.

Results

When it comes to network, endpoint, and cloud visibility, Devo makes it easy to see all of that. It's all on one dashboard, it's all visible. Instead of having to jump from system to system to system, we can see all of our web traffic and we can see endpoint stats, and whether we need to investigate anything. It's very useful. It definitely raises the level of confidence when we need to take action, compared to our last tool.

Use Case

We use it for monitoring our core set of network devices, our key systems. We're collecting all the log traffic and using it as a platform to correlate and set up alerts to monitor, and looking for any suspicious behavior.

It's very intuitive. The interface is extremely useful. You can perform many functions from one page.

The solution has saved us time, although we're still in the learning stage. We've only had it in place for three months. I would venture that it's probably saving a few hours a week per analyst, but I expect that to grow as we get better at using it.

When it comes to network, endpoint, and cloud visibility, Devo makes it easy to see all of that. It's all on one dashboard, it's all visible.

ROI

So far we've seen ROI from the fact that when the auditor comes in quarterly and looks at it, as happened the other day, they are extremely impressed. The return value is going to be there. It's already starting, where we're creating custom dashboards for various groups to look at their own data. We don't have to provide reports anymore. We just give them the data and they can log in and look at whatever they want in real time.

It's going to be huge as we move further down the road and we learn to better utilize the tool. We have some big plans for it.
