

SAP PowerConnect for Devo

Cloud-native logging and security analytics meets SAP data

SOLUTION BRIEF

INGEST SAP DATA INTO DEVO TO MONITOR, INVESTIGATE, AND ACT ON THREATS THAT JEOPARDIZE YOUR SECURITY POSTURE

Organizations around the globe rely on SAP software to run their essential business processes. While SAP software is extremely useful and powerful, security teams struggle to ingest SAP data into their logging and security analytics tools so they can effectively monitor their SAP systems. Devo and RHONDOS have created an integrated solution – SAP PowerConnect for Devo – available for mutual customers that simplifies how organizations ingest SAP data into Devo to take advantage of Devo’s powerful data visualizations, alerting capabilities, and analytics. This enables organizations to spend less on SAP monitoring and gain a holistic understanding of both business health and SAP systems.

UNLOCK NEAR-REAL-TIME INSIGHTS FROM YOUR SAP DATA TO MONITOR SYSTEM PERFORMANCE AND DETECT SUSPICIOUS ACTIVITY

SAP application data flows through the SAP NetWeaver stack and is saved in the database layer that sits underneath NetWeaver. Because of this, very little data is accessible outside of SAP and that requires manual, resource-intensive monitoring of SAP systems to ensure optimal performance and security. SAP PowerConnect for Devo solves this problem by using SAP-certified add-ons to collect the data from the database, NetWeaver, and application layers and send it securely to Devo. Once in Devo, organizations gain near-real-time insights into SAP system performance and security, which simplifies monitoring.

USE CASES

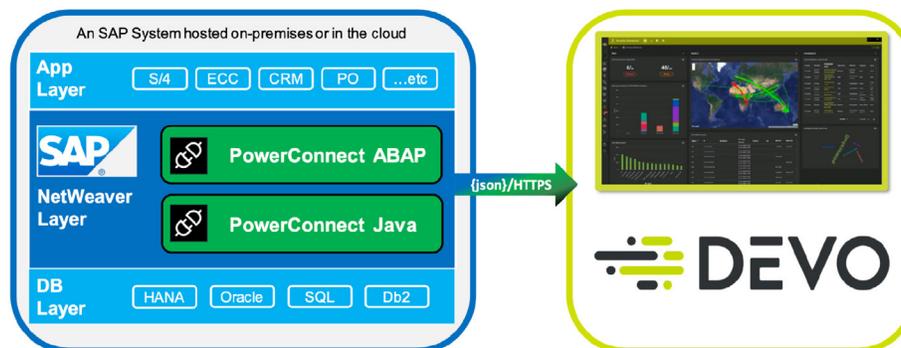

Security monitoring of SAP systems

Devo enables you to get near-real-time insights into your SAP security data by correlating it against non-SAP data to better monitor, investigate and act on threats targeting your organization.

Performance monitoring of SAP systems

Devo enables you to ensure that your SAP systems are operating at peak performance by continually informing your team of system problems so you can address performance issues and reduce costly system downtime.

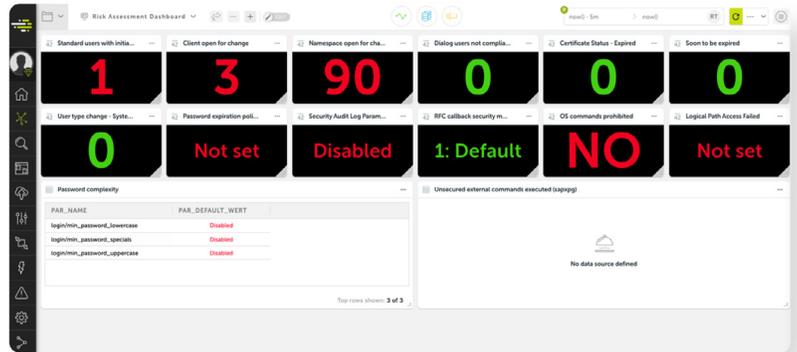

SAP PowerConnect for Devo equips customers with Activeboards that provide data visualization and performance metrics. Activeboards help reduce SAP data complexity by readily providing the needed insights into SAP security and performance data to expedite actionable analysis. Activeboards are accessible through Devo Exchange, Devo’s community-based marketplace, which is continually updated with Devo-curated content. SAP PowerConnect for Devo includes Activeboards such as:

The Risk Assessment Activeboard

The Risk Assessment Activeboard provides security teams with a snapshot of the risk the organization incurs from its SAP systems. The Risk Assessment Dashboard includes the following key metrics:

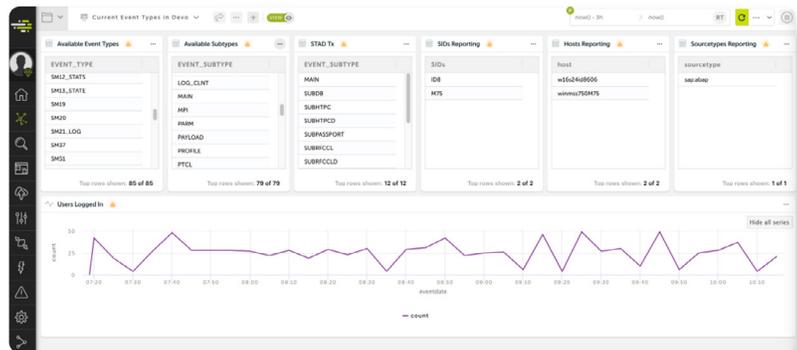

- Risk access login by privileged user
- Users with default or known password
- Clients open for change
- Login by multiple IDs on a single terminal
- Change in RFC destination
- Execution of sensitive transactions

The Current Event Types in Devo Activeboard

The Current Event Types in Devo Activeboard provides users with key metrics about identity and access management along with user-based access controls. The User Activity and Password Status Activeboard provides the following metrics:

- Successful and failed GUI & RFC logins
- Number of logged-in users
- Role and profile changes
- Users by type and instance
- Failed transaction start RSUSR200/003 reports

For SAP security data sets, SAP PowerConnect for Devo delivers critical security insights into user behavior, systems, authorization changes, user-status reports, and SAP system security posture checks in near-real-time. SAP PowerConnect for Devo also gives analysts the ability to query SAP data within the Devo Platform and create alerts based on queries for proactive monitoring and faster identification of signs of compromise. Ultimately, equipping teams with crucial SAP performance and security data within the Devo Platform will reduce costly downtime of business-critical SAP systems and enable fast identification of potential security breach impacts.

Are you ready to learn more about ingesting SAP data into Devo?
